EDITORIAL

Dr Nupur Shrirao

She is a consultant Prosthodontist and esthetic dentist. She is currently in the Editorial Committee of 'International Journal Of Innovative Research In Dental Sciences (IJIRDS)' and the Reviewer Board of 'Journal of International Oral Health (JIOH)' and 'IP Annals of Prosthodontics & Restorative Dentistry (APRD).'

Midway through this month, 72 years ago, India attained freedom for herself. Freedom essentially means having the choice to do as one pleases. While on the surface this seems like a basic right, is it wise to use an abundance of freedom carelessly? Especially in healthcare, it can have two different faces. On one hand, the Govt. has ensured the poor, freedom to get treatment through the Ayushman Bharat Yojna. On the other hand, the Govt. has ensured the non-MBBS medicos to give treatment through the NMC Bill.

How much freedom is too much freedom? Should freedom be substantiated with evidence, logic, experience?

MANAGING AN ATROPHIC MANDIBLE WITH SHORT IMPLANTS

Avoiding invasive surgeries for resorbed mandible by placing short implants! Short implants with increased diameter provide better primary stability as well as increased functional surface area. Moreover, its survival time is comparable with long implants.

It results in lesser healing period, faster rehabilitation & high patient acceptance as advanced surgeries are avoided. Use of short implants is a predictable, well documented procedure and a cost effective, viable alternative to surgical interventions.

MINI IMPLANTS IN FPD AND RPD

Mini dental implants are implants with diameters of 1.8 to 3.3 mm. Studies suggest that they can be used to retain CDs and RPDs and support FPDs in selected patients.

Mini implants can be placed without raising a flap, can be immediately loaded, and they follow the trend of Minimally Invasive Dentistry.

Mini implant is a premium implant design feature with a predictable functional and esthetic outcome! Click below to read more!

ADVANCES IN THE FIELD OF MAXILLOFACIAL IMAGING: AN INNOVATION OR A CELESTIAL BOON?

Visualising what's inside the human body without touching or operating, radiographic imaging has been a magical invention! It has advanced tremendously since its inception in dentistry.

From 2D intraoral small films to orthopantomograms and 3D CT and CBCT scans. From conventional dental films to image plate sensors and portable X-ray cameras. From arthroscopy to scintigraphy and T scans.

Maxillofacial imaging has gone from being a scientific invention to a celestial boon in diagnosis and treatment planning! Click below to read more!

LINGUAL FRENECTOMY USING DIODE LASER- A CASE REPORT

'Ankyloglossia' or tongue tie is a congenital anomaly caused by an abnormally short, tight lingual frenulum resulting in limitation of tongue movement.

'Frenectomy' corresponds to the complete excision of the frenulum.

It can be performed using diode lasers as they are excellent coagulators. Patient can be discharged on the same day with analgesics and oral physiotherapy should be advised. Click below to read more!

PLIGHT OF GRADUATING DENTISTS IN INDIA

Dentists are infamous for earning big bucks!

But some problems are plaguing our field like quackery and unethical practices, 'Locum' or less pay by our senior dentists, very low treatment charges by fellow dentists lack of job opportunities & outdated dental school teachings.

But every dark cloud has a silver lining and every problem has a viable solution! Click below to read more!
